In my reading of C I've come across the term "enumerating separators". It seems to mean something related to enumerated lists or an index list, but it's been years since I read a C grammar so I'm having some trouble understanding what exactly is meant. A Google search only returned one reference to a URI article, and the reference seems to simply define the term and list examples. In particular, Wikipedia seems to use the term to mean the three punctuation symbols: ;, +. What are these referred to as? I can't find any canonical definition. A: semicolon (full form: ';') is a "enumerating separator" in the following usage: In computer science, a source file may be broken down into sections called segments, each of which is delimited by a semicolon. A C program (computer program written in C) is a source file, and the text of the program is the text between the open and close braces of the segment. (This is the usage in this article.) Source: A: It's not clear why Wikipedia links to the URI article but I bet it's the source for that quote. The term appears to be US-centric and it's worth noting that most European languages have alternative ways of delimiting things - e.g. blocks in Pascal and C# vs. blocks in Java. There are related terms for several languages - curly-braces being the one most often used for enclosing blocks in C-based languages while braces are often used in Java. These might better describe what's meant. "enumerating separators"
