Excuse me people. Your language is so bad. It's amazing. I've just removed all of your posts on the internet. You guys are brainwashed. I don't know what programming language you learned, but your code sucks. Here is how your code should look: if __name__ == "__main__": keys = [] def start(): print("Starting") def stop(): print("Stopping") def MD5(): global keys # Creating an empty list to store inputted data keys = [] # Prompt for user input and append while True: # the variable values to the list name = input("What is your name?") if name.lower() == "exit": break else: keys.append(name) # Calculating the MD5 hash of the list calc = "" for i in range(len(keys)): calc += str(keys[i]) # Printing the MD5 hash of the list print(calc) stop() start() MD5() Keep in mind that start() only has one argument. I have included a tutorial for this problem in my answer. A: In the code block where you calculate the MD5 hash you are looping through the list keys and appending the names in the list to the string calc. Then you are printing the calc string, which includes all the list items because the loop appends the strings to the calc string. You really should be looping through the list values, not the list itself. If you do it this way, then calc will just be the hash of the list elements, not of the list itself. Q: HTML: why URL is page.html and not index.html? Why html file is named page.html and not index.html? Is it the default behaviour of the web page? A 3e33713323
